I am Kinyida Greenlee, a first-year majoring in Computer Science at the University of South Carolina, and this is my mission statement. My short term goals are to take programming, game design, and artificial intelligence courses, learn to code in Java (a programming language), work on my original game idea, join student organizations related to my major, read more books, and stay active. My course goals will be fulfilled by my pursuit of a degree in Computer Science and the possibility of a concentration in artificial intelligence. In my Algorithmic Design I class, I am learning to program in Java which will expand my coding knowledge and toolkit. I can then apply this gained knowledge to working on my game idea, which has been limited to the confines of a google document. Future coursework will also help bolster my skills and provide more understanding of how to make a functioning program. By joining clubs related to computer science, I can make connections to people in my field of interest and gain insight I would not have otherwise. I want to read more books and stay active to keep my mind and body healthy.

My medium term goals are to graduate college with a Bachelor's Science degree in Computer Science, get a job in software engineering, software development, or game development, work for an organization that values its employees, create a working and enjoyable computer game, and become financially stable. My short-term goal of taking courses that pertain to my major will help me attain my diploma. After graduating, my diploma and experience will be the credentials I use to apply for a job in my field of interest. In order to ensure the organization or company I work for values its employees, I will research the companies where I apply for jobs. Using a budget and managing my funds well by keeping my spending in check will be a good start to stabilize my finances.

My long term goals are to buy my own house and car, retire after a successful career, and enjoy life for what it is. My short term and medium term goals will help with my ambitions by providing a solid foundation and understanding of my desired career field, and then working in the field to sustain a livelihood. I am unsure about how big I want the house to be, but I definitely would get a Chevrolet Corvette. I think it is important to enjoy life for what it is because often people have grand expectations of what they want and I simply want to enjoy things as they happen.
